Today refactoring requires considerable design know-how, but once tools become available, all programmers should be able to improve their code using refactoring techniques. **Refactoring - Improving the Design of Existing code** Refactoring: (Definition) Refactoring is the process of changing a software system in such a way that it does not alter the external behavior of the code yet improves its internal structure. **Refactoring - Martin Fowler** Refactoring is a controlled technique for improving the design of an existing code base. Its essence is applying a series of small behavior-preserving transformations, each of which "too small to be worth doing". However the cumulative effect of each of these transformations is quite significant.
